## **ABSTRACT**

An experiment was carried out during winter season of 2014 in Department of Fruit Science and Horticulture Technology, College of Agriculture, Orissa University of Agriculture and Technology, Bhubaneswar, Odisha. The experiment was conducted in randomized block design with ten treatments comprising of three levels each of Gibberellic Acid (25, 50, 100 ppm), Ethrel (25, 50, 100 ppm) and Naphthalene Acetic Acid (25, 50, 100 ppm) replicated thrice to evaluate the effect of these plant growth regulators on growth, flowering and yield characters in African marigold. The observed vegetative traits like plant height, numbers of branches per plant, number of leaves per plant and plant girth and different flowering as well as yield attributing traits like early flower bud initiation, opening of first flower and maximum duration of flowering, flower stalk length, number of flowers per plant, weight of flower, weight of flowers per plant and flower yield per plant were found to be maximum from the treatment of Gibberellic Acid @100 ppm as compared to other treatments.

KEY WORDS: Flower yield, Flowering attributes, Marigold, Plant growth regulators.

#### Introduction

Marigold (Tagetes erecta L.) is an important commercial flower in India belongs to family Asteraceae (Compositae). It is very popular due to easy to grow and wider adaptability. In India, African marigold flowers are sold in the market as loose for making garland. Flowers are traditionally used for offering in temple, churches and used in festival for beautification of landscape. It is highly suitable for making flower beds in herbaceous border and also found ideal for newly planted shrubberies to provide colour and fill the gap in landscape. Both leaves and flowers possesses medicinal values. Growth regulators find their extensive use in ornamental crops for modifying their developmental process. Plant growth regulators play an important role in flower production, which in small amount promotes or inhibits or quantitatively modifies growth and development. Gibberellic acid increased to be very effective in manipulating growth and flowering in marigold (Kumar et al., 2014). Ethrel retard plant height, number of nodes and internodal length, increase branching and delayed flowering (Sachs, 1961). Naphthalene Acetic Acid is reported to be a rooting promoter improve plant growth (Ullah et al, 2013). The experiment was carried out to asses the optimum concentration of various growth regulators to cause beneficial effect on growth and flowering behaviour of marigold.

### Materials and Methods

The experiment was conducted during winter season of 2014-2015 at the Department of Fruit Science and Horticulture Technology, College of Agriculture, Orissa University of Agriculture and Technology, Bhubaneswar, Odisha, India. Recommended doses of NPK and other inputs were applied at appropriate time. The treatments comprising of three doses each of GA<sub>3</sub> (25, 50 and 100 ppm) Ethrel (25, 50 and 100ppm) and NAA(25,50 and 100ppm). Spraying of growth regulators were done 30 days after transplanting. In this experiment T<sub>1</sub> is taken as control, T<sub>2</sub> as GA<sub>3</sub> @ 25 ppm, T<sub>3</sub> as GA<sub>3</sub> @ 50 ppm, T<sub>4</sub> as GA<sub>3</sub> @ 100 ppm, T<sub>5</sub> as Ethrel @ 25 ppm, T<sub>6</sub> as Ethrel @ 50 ppm, T<sub>7</sub> as Ethrel @ 100 ppm, T<sub>8</sub> as NAA @ 25 ppm, T<sub>9</sub> as NAA @ 50 ppm, T<sub>10</sub> as NAA @ 100 ppm. The experiment was laid out in a randomized block design with three replication. Twenty days old seedling of African marigold (Tagetes erecta L.) were planted. Different growth attributes like plant height, numbers of branches per plant, number of leaves per plant and plant girth were recorded to know the significant effect of different growth regulators. The important flowering characters viz. days taken to first flower bud initiation, days taken to opening of first flower, duration of flowering, length of flower stalk (cm), diameter of flower (cm), number of flower per plant and yield characters such as weight of flower (g), flowers yield per plant (g) were recorded in five randomly selected plants per replication in each treatment. The data were analyzed by method suggested by Fisher and Yates (1949).

## Results and Discussion

## Effect of Growth regulators on growth attributes:

**Plant Height**: Plants treated with 100 ppm  $GA_3(T_4)$  showed the maximum plant height (36.55cm) followed by  $T_3(GA_3 @ 50 \text{ ppm})$  and minimum plant height (24.32cm) was recorded from the plant sprayed with 100 ppm NAA.

Numbers of branches per plant: Maximum numbers of branches (35.22) were found from the plants sprayed with  $100 \, \text{ppm GA}_3$  and minimum of that recorded from the plants treated with  $100 \, \text{ppm NAA}$ .

**Number of leaves per plant**: From Table 1, It was revealed that plant treated with 100 ppm  $GA_3(T_4)$  produced maximum number of leaves (92.5). Minimum number of leaves was at found at from the plant sprayed with normal water (control).

Table 1: Effect of different plant growth regulators on Growth Attributes of African Marigold

Treatments	Plant Height (cm)	Number of branches per plant	Number of leaves per plant	Plant Girth (cm)
T1	27.800	23.400	46.500	1.367
T2	34.900	28.700	73.400	2.167
Т3	35.667	30.100	76.500	2.133
T4	37.133	35.200	82.200	2.600

T10	28.000	28.200	60.800	1.500
Sem	0.492	0.320	0.526	0.190
CD @5%	1.460	0.950	1.564	0.565

**Plant girth**: Maximum plant girth was obtained from the plant treated with 100 ppm GA, (2.6 cm), minimum plant girth was observed at control.

Foliar application of GA3 (100 ppm) significantly increased the plant height (36.55 cm), Numbers of Branches per plant, Number of Leaves per Plant and Plant girth compared to other growth regulator treatments and control (Table 1). This may be due to enhanced cell division and cell enlargement, promotion of protein synthesis by GA which might have resulted in enhanced vegetative growth. Similar results were reported by Sunitha *et al.* (2007) in African marigold and Verma *et al.* (2000) in carnation.

# $Effect of \ Growth \ regulators \ on \ flowering \ attributes:$

All the parameter were influenced significantly due to various plant growth regulators (table 2).

T10	59.100	107.967	30.567	7.733	55.933	8.500
Sem	0.547	0.461	1.159	0.175	1.105	0.237
CD @5%	1.625	1.370	3.444	0.519	3.281	0.705

#### Days taken to first flower bud initiation:

Plants treated with GA<sub>3</sub> @ 100 ppm found to form first bud on 44.9 days after transplanting where as the plants sprayed with normal water produce first bud on 61.8 days. Gibberellins reduces juvenile period and with the termination of juvenile phase, the shoot apical meristem instead of producing leaves and branches start producing buds. Similar finding were also reported by Dahiya and Rana (2001)

# Days taken to opening of first flower:

Minimum number of days taken to opening of first flower was observed with the application of  $GA_3$  100 ppm and maximum number of days (107. 97) taken to opening of first flower were found from the plant treated with NAA@ 100 ppm ( $T_{10}$ ).

## **Duration of Flowering:**

Ga3 was found most effective in extending the flower duration (53.17 days) especially with  $GA_3$  100 ppm. It might be due to advanced stage of flowering in marigold. Dutta *et al.* (1998). But spray of NAA @ 100 ppm reduces the duration of flowering to 30.56 days.

## Flower stalk length and flower diameter

Significantly maximum flower stalk length (8.93 cm) and maximum flower diameter (9.4 cm) were recorded with foliar spray of GA<sub>3</sub> 100 ppm. The increment in stalk length and flower diameter might be due to enhanced cell division and cell enlargement, promotion of protein synthesis coupled with higher dry matter accumulation (Dalal *et al*, 2009). Similar result was also reported by Tyagi and Kumar (2006).

# Number of flowers per plant:

Maximum number of flowers per plant were recorded with application of  $GA_3$  100 ppm (65.76). The enhancement in number of flowers per plant might be due to the production of large number of laterals at early stage of growth which had sufficient time to accumulate carbohydrate for proper flower bud differentiation due to enhanced reproductive efficiency and photosynthesis restrictive plant type. The result was in close conformity with Sunitha *et al.* (2007).

# Effect of Growth regulators on yield attributes: Weight of flower and yield of flower per plant:

Weight of flower was reported significantly maximum (15.4 g) with application of GA $_3$  100 ppm (table 3). Significantly maximum yield of flower per plant (987.167 g) were recorded with foliar application of GA $_3$  100 ppm. Verma and Arha (2004) and Devadanam *et al.* (2007) also observed maximum flower yield per hectare with GA $_3$  treatment in African marigold.

Table 3: Effect of different plant growth regulators on Yield Attributes of African Marigold

Treatments	Weight of Flowers (g)	Flower yield per plant (g)				
T1	7.800	320.000				
T2	10.400	557.700				
Т3	13.100	742.167				
T4	15.400	987.167				
T5	10.433	455.333				
Т6	11.333	530.533				
T7	11.767	585.967				
Т8	11.167	532.033				
Т9	11.033	575.433				
T10	11.967	622.500				
Sem	0.236	7.127				
CD @5%	0.702	21.174				

**Conclusion:** From the above experiment it was revealed that different vegetative characters like height, numbers of branches per plant, number of leaves per plant and plant girth were maximum on the plant treated with  $GA_3$  @ 100 ppm . Similarly different flowering and yield attributing characters like early flower bud initiation, opening of first flower and maximum duration of flowering, flower stalk length, number of flowers per plant, weight of flowers per plant and flower yield per plant were found to be maximum from  $GA_3$  treated plant at a concentration of 100 ppm as compared to other treatments.
